

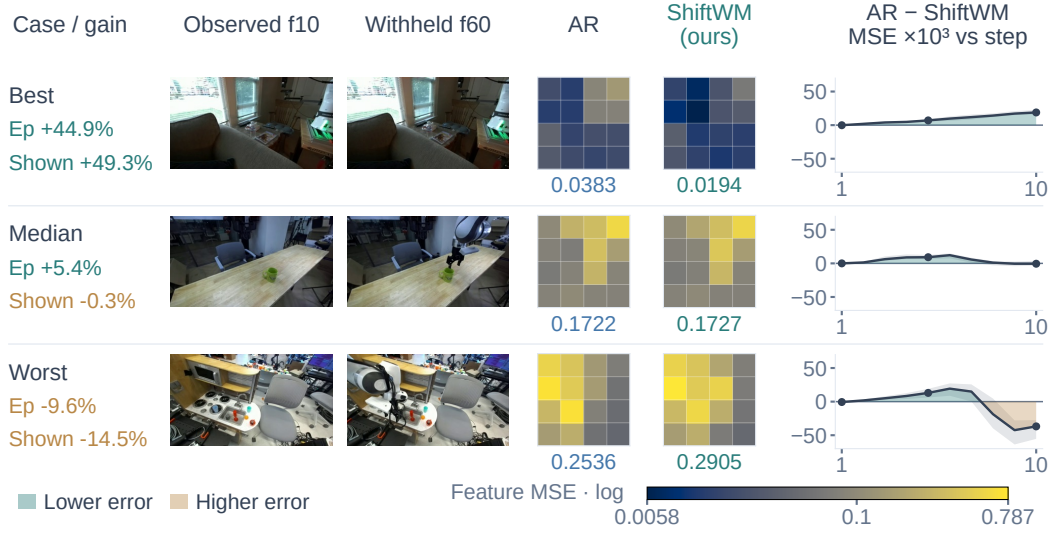

Figure 1: **Prespecified best, median and worst cases.** The episode-gain ranks among 141 DROID development recordings each show their first eligible window. AR denotes matched autoregression. Full RGB frames are recorded observations (f_{10}) and withheld targets (f_{60}). Maps show three-seed native, training-standardized $h = 10$ feature MSE on one unclipped logarithmic scale. Curves show mean paired AR-minus-ShiftWM error with common $\pm 70 \times 10^{-3}$ MSE limits; bands show seed minima/maxima, not confidence intervals. Teal gains mean lower error; amber shows regressions. Each forecast step consumes five native commands. Episode (Ep) gains average windows; the shown median window instead regresses.
